

# POLLINATE PRO

## Easy In-Field Application Guide

Application of Pollinate Pro is fast and easy. Simply use a standard 300 ml caulking gun and insert the Pollinate Pro cartridge per instructions for gun. Cut the tip of the Pollinate Pro cartridge to create an opening between 1/8<sup>th</sup> and 1/4<sup>th</sup> of inch at a slight angle to ensure even flow. Use stick on gun or straight wire to break the seal inside the tube of the cartridge. Dispense the product at an even flow rate until approximately 1ml of product is dispensed on to a dry surface such as a hardened plant surface (bark), trellising, spreading poles, etc.. Application location will depend on canopy height. In most cropping systems, Pollinate Pro can be applied at approximately 2-3 meters high within the canopy. Avoid contact with skin or clothes as Pollinate Pro begins to cure and adheres tightly after application. Product cures quickly and is rain-fast shortly after application. Placement chart available for droplet placement and uniformity.

Apply approx. 300 uniformly dispersed 1 ml droplets of Pollinate Pro per acre (750 per hectare)

26:1 Caulking Gun for 300 ml Cartridge

Dispense 1 ml Droplet to Dry Surface, 2-3 meters high within canopy

### QUICK APPLICATION POINTS

- Use standard 300 ml caulking gun
- Insert Pollinate Pro cartridge per gun instructions
- Cut tip of cartridge to create opening between 1/8<sup>th</sup> and 1/4<sup>th</sup> inch at slight angle
- Use stick on gun or straight wire to puncture seal inside tube of cartridge
- Dispense approx. 300- 1ML droplets per acre (750 per hectare) evenly throughout the area
- Use placement chart for droplet placement and uniform application
